Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

# Module 35: Programming in C++

## Multiple Inheritance

Instructors: Abir Das and Sourangshu Bhattacharya

Department of Computer Science and Engineering  
Indian Institute of Technology, Kharagpur

*{ abir, sourangshu }@cse.iitkgp.ac.in*

Slides taken from NPTEL course on Programming in Modern C++

by **Prof. Partha Pratim Das**

# Module Recap

## Module 35

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

### Objectives & Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

`protected` Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

- Understood casting at run-time
- Studied `dynamic_cast` with examples
- Understood RTTI and `typeid` operator

# Module Objectives

## Module 35

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

- Understand Multiple Inheritance in C++

### Objectives & Outlines

#### Multiple Inheritance in C++

#### Semantics

#### Data Members

#### Overrides and Overloads

#### protected Access

#### Constructor & Destructor

#### Object Lifetime

#### Diamond Problem

#### Exercise

#### Design Choice

#### Module Summary

# Module Outline

## Module 35

Instructors: Abir  
Das and

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

- **TA ISA Student; TA ISA Faculty**

```
class Student;                                // Base Class = Student
class Faculty;                                // Base Class = Faculty
class TA: public Student, public Faculty;      // Derived Class = TA
```

- **TA** inherits properties and operations of both **Student** as well as **Faculty**

# Multiple Inheritance in C++: Hierarchy

- **Manager ISA Employee, Director ISA Employee, ManagingDirector ISA Manager, ManagingDirector ISA Director**

```
class Employee;                                     // Base Class = Employee -- Root
class Manager: public Employee;                       // Derived Class = Manager
class Director: public Employee;                      // Derived Class = Director
class ManagingDirector: public Manager, public Director; // Derived Class = ManagingDirector
```

- **Manager** inherits properties and operations of **Employee**
- **Director** inherits properties and operations of **Employee**
- **ManagingDirector** inherits properties and operations of both **Manager** as well as **Director**
- **ManagingDirector**, by transitivity, inherits properties and operations of **Employee**
- **Multiple inheritance hierarchy usually has a common base class**
- This is known as the **Diamond Hierarchy**

# Multiple Inheritance in C++: Semantics

- Derived ISA Base1, Derived ISA Base2

```
class Base1; // Base Class = Base1
class Base2; // Base Class = Base2
class Derived: public Base1, public Base2; // Derived Class = Derived
```

- Use keyword **public** after class name to denote inheritance
- Name of the Base class follow the keyword
- There may be more than two base classes
- public** and **private** inheritance may be mixed

# Multiple Inheritance in C++: Semantics

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

- Data Members
  - Derived class *inherits all* data members of *all* Base classes
  - Derived class may *add* data members of its own
- Member Functions
  - Derived class *inherits all* member functions of *all* Base classes
  - Derived class may *override* a member function of *any* Base class by *redefining* it with the *same signature*
  - Derived class may *overload* a member function of *any* Base class by *redefining* it with the *same name*; but *different signature*
- Access Specification
  - Derived class *cannot access private* members of *any* Base class
  - Derived class *can access protected* members of *any* Base class
- Construction-Destruction
  - A *constructor* of the Derived class *must first* call *all constructor*s of the Base classes to construct the Base class instances of the Derived class – Base class *constructor*s are called in *listing order*
  - The *destructor* of the Derived class *must* call the *destructor*s of the Base classes to destruct the Base class instances of the Derived class.

# Multiple Inheritance in C++: Data Members and Object Layout

Module 35

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

- Data Members

- Derived class *inherits all* data members of *all* Base classes
- Derived class may *add* data members of its own

- Object Layout

- Derived class *layout* contains instances of *each* Base class
- Further, Derived class *layout* will have data members of its own
- C++ does not guarantee the *relative position* of the Base class instances and Derived class members

# Multiple Inheritance in C++: Data Members and Object Layout

## Module 35

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

```
class Base1 { protected:  
    int i_, data_;  
public: // ...  
};  
class Base2 { protected:  
    int j_, data_;  
public: // ...  
};  
class Derived: public Base1, public Base2 { // Multiple inheritance  
    int k_;  
public: // ...  
};
```

## Object Layout

Object Base1

Object Base2

Object Derived

- Object Derived has two **data\_** members!

- Ambiguity to be resolved with base class name: **Base1::data\_** & **Base2::data\_**

# Multiple Inheritance in C++: Member Functions – Overrides and Overloads

Module 35

Instructors: Abir

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

```
class Base1 { protected: int i_, data_;
public: Base1(int a, int b): i_(a), data_(b) { }
    void f(int) { cout << "Base1::f(int) \n"; }
    void g() { cout << "Base1::g() \n"; }
};
class Base2 { protected: int j_, data_;
public: Base2(int a, int b): j_(a), data_(b) { }
    void h(int) { cout << "Base2::h(int) \n"; }
};
class Derived: public Base1, public Base2 { int k_;
public: Derived(int x, int y, int u, int v, int z): Base1(x, y), Base2(u, v), k_(z) { }
    void f(int) { cout << "Derived::f(int) \n"; } // -- Overridden Base1::f(int)
    // -- Inherited Base1::g()
    void h(string) { cout << "Derived::h(string) \n"; } // -- Overloaded Base2:: h(int)
    void e(char) { cout << "Derived::e(char) \n"; } // -- Added Derived::e(char)
};
```

```
Derived c(1, 2, 3, 4, 5);
```

```
c.f(5); // Derived::f(int) -- Overridden Base1::f(int)
c.g(); // Base1::g() -- Inherited Base1::g()
c.h("ppd"); // Derived::h(string) -- Overloaded Base2:: h(int)
c.e('a'); // Derived::e(char) -- Added Derived::e(char)
```

# Inheritance in C++:

Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

### Ambiguous Calls

```
class Base1 { public:
    Base1(int a, int b);
    void f(int) { cout << "Base1::f(int) "; }
    void g() { cout << "Base1::g() "; }
};

class Base2 { public:
    Base2(int a, int b);
    void f(int) { cout << "Base2::f(int) "; }
    void g(int) { cout << "Base2::g(int) "; }
};

class Derived: public Base1, public Base2 {
public: Derived(int x, int y, int u, int v, int z);

};

Derived c(1, 2, 3, 4, 5);

c.f(5); // Base1::f(int) or Base2::f(int)?
c.g(5); // Base1::g() or Base2::g(int)?
c.f(3); // Base1::f(int) or Base2::f(int)?
c.g();  // Base1::g() or Base2::g(int)?
```

### Unambiguous Calls

```
class Base1 { public:
    Base1(int a, int b);
    void f(int) { cout << "Base1::f(int) "; }
    void g() { cout << "Base1::g() "; }
};

class Base2 { public:
    Base2(int a, int b);
    void f(int) { cout << "Base2::f(int) "; }
    void g(int) { cout << "Base2::g(int) "; }
};

class Derived: public Base1, public Base2 {
public: Derived(int x, int y, int u, int v, int z);
    using Base1::f; // Hides Base2::f
    using Base2::g; // Hides Base1::g
};

Derived c(1, 2, 3, 4, 5);

c.f(5);          // Base1::f(int)
c.g(5);          // Base2::g(int)
c.Base2::f(3);   // Base2::f(int)
c.Base1::g();    // Base1::g()
```

- **Overload resolution does not work between `Base1::g()` and `Base2::g(int)`**
- **using hides other candidates; Explicit use of base class name can resolve (weak solution)**

# Multiple Inheritance in C++:

Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

```
class Base1 { protected: int i_; int data_;
public: Base1(int a, int b): i_(a), data_(b)
    { cout << "Base1::Base1() " << i_ << ' ' << data_ << endl; }
    ~Base1() { cout << "Base1::~Base1() " << i_ << ' ' << data_ << endl; }
};

class Base2 { protected: int j_; int data_;
public: Base2(int a = 0, int b = 0): j_(a), data_(b)
    { cout << "Base2::Base2() " << j_ << ' ' << data_ << endl; }
    ~Base2() { cout << "Base2::~Base2() " << j_ << ' ' << data_ << endl; }
};

class Derived: public Base1, public Base2 { int k_; public:
    Derived(int x, int y, int z): Base1(x, y), k_(z)
    { cout << "Derived::Derived() " << k_ << endl; }
    // Base1::Base1 explicit, Base2::Base2 default
    ~Derived() { cout << "Derived::~Derived() " << k_ << endl; }
};
```

Derived d(5, 3, 2);

## Construction O/P

```
Base1::Base1(): 5, 3 // Obj. d.Base1
Base2::Base2(): 0, 0 // Obj. d.Base2
Derived::Derived(): 2 // Obj. d
```

## Destruction O/P

```
Derived::~Derived(): 2 // Obj. d
Base2::~Base2(): 0, 0 // Obj. d.Base2
Base1::~Base1(): 5, 3 // Obj. d.Base1
```

- First construct base class objects, then derived class object
- First destruct derived class object, then base class objects

Module Summary

## Diamond Problem

# Multiple Inheritance in C++: Diamond Problem

- **Student ISA Person**
- **Faculty ISA Person**
- **TA ISA Student; TA ISA Faculty**

```
class Person;                                // Base Class = Person -- Root
class Student: public Person;                // Base / Derived Class = Student
class Faculty: public Person;                // Base / Derived Class = Faculty
class TA: public Student, public Faculty;    // Derived Class = TA
```

- **Student** inherits properties and operations of **Person**
- **Faculty** inherits properties and operations of **Person**
- **TA** inherits properties and operations of both **Student** as well as **Faculty**
- **TA**, by transitivity, inherits properties and operations of **Person**

Module Summary

```
#include<iostream>
using namespace std;

class Person { // data members of person
    public: Person(int x) { cout << "Person::Person(int)" << endl; }
};
class Faculty: public Person { // data members of Faculty
    public: Faculty(int x): Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};
class Student: public Person { // data members of Student
    public: Student(int x): Person(x) { cout << "Student::Student(int)" << endl; }
};
class TA: public Faculty, public Student {
    public: TA(int x): Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
};
int main() { TA ta(30);
}
```

```
Person::Person(int)
Faculty::Faculty(int)
Person::Person(int)
Student::Student(int)
TA::TA(int)
```

- Two instances of base class object (Person) in a TA object!

# Multiple Inheritance in C++:

## virtual Inheritance – virtual Base Class

### Module 35

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

```
#include<iostream>
using namespace std;
class Person { // data members of person
    public: Person(int x) { cout << "Person::Person(int)" << endl; }
    Person() { cout << "Person::Person()" << endl; } // Default ctor for virtual inheritance
};
class Faculty: virtual public Person { // data members of Faculty
    public: Faculty(int x): Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};
class Student: virtual public Person { // data members of Student
    public: Student(int x): Person(x) { cout << "Student::Student(int)" << endl; }
};
class TA: public Faculty, public Student {
    public: TA(int x): Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
};
int main() { TA ta(30); }
```

Person::Person()

Faculty::Faculty(int)

Student::Student(int)

TA::TA(int)

- Introduce a default constructor for root base class **Person**
- Prefix every inheritance of **Person** with **virtual**
- **Only one instance of base class object (Person) in a TA object!**

# Multiple Inheritance in C++: virtual Inheritance with Parameterized Ctor

Module 35

C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

```
#include<iostream>
using namespace std;

class Person {
    public: Person(int x) { cout << "Person::Person(int)" << endl; }
    Person() { cout << "Person::Person()" << endl; }
    virtual ~Person();
    virtual void teach() = 0;
};

class Faculty: virtual public Person {
    public: Faculty(int x): Person(x) { cout << "Faculty::Faculty(int)" << endl; }
    virtual void teach();
};

class Student: virtual public Person {
    public: Student(int x): Person(x) { cout << "Student::Student(int)" << endl; }
    virtual void teach();
};

class TA: public Faculty, public Student {
    public: TA(int x): Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
    virtual void teach();
};
```

- In the absence of `TA::teach()`, which of `Student::teach()` or `Faculty::teach()` should be inherited?

# Multiple Inheritance in C++: Exercise

# Design Choice: Inheritance or Composition

- **Vehicle** Hierarchy

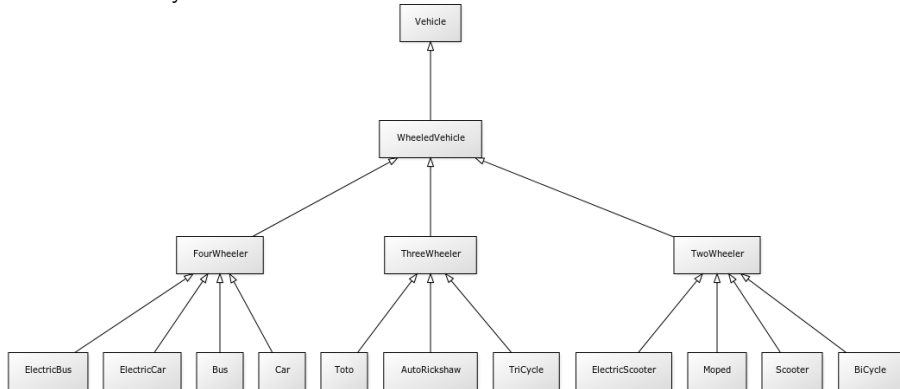

- **Wheeled** Hierarchy and **Engine** Hierarchy interact
- Large number of cross links!
- Multiplicative options make modeling difficult

# Design Choice: Inheritance or Composition

- **Vehicle Hierarchy**

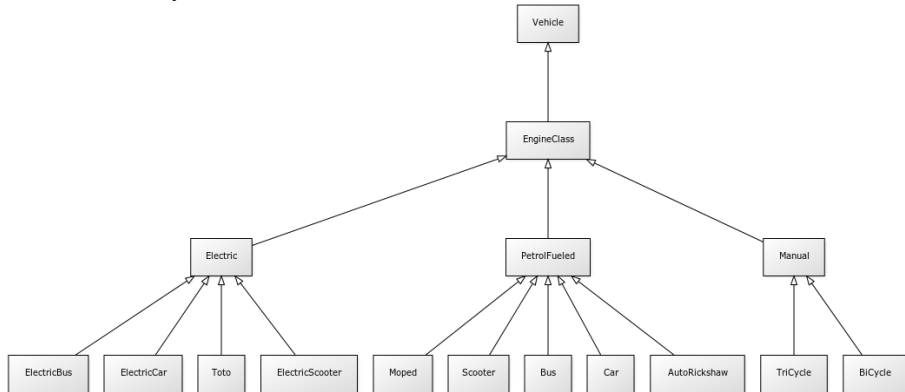

- **Wheeled** Hierarchy use **Engine** as Component
- Linear options to simplify models
- Is this dominant?

# Design Choice: Inheritance or Composition

- **Vehicle Hierarchy**

- **Engine Hierarchy** use **Wheeled** as Component
- Linear options to simplify models
- Is this dominant?

# Module Summary

## Module 35

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Multiple  
Inheritance in  
C++

Semantics

Data Members

Overrides and  
Overloads

protected Access

Constructor &  
Destructor

Object Lifetime

Diamond  
Problem

Exercise

Design Choice

Module Summary

- Introduced the Semantics of Multiple Inheritance in C++
- Discussed the Diamond Problem and solution approaches
- Illustrated the design choice between inheritance and composition
